#### Question: What all OS' have you used?

#### Question: What all OS' have you used?

Any major change in recent OS?

# Why Study OS?

- "Systems" bucket important branch of CS
- Use it everyday Gratitude towards those who made our lives easier!
- Application of DS, Algorithms
  - Heaps, Stacks,...
- Placements?! :)

# What is an OS?

Applications

 Next time I open Keynote/Adobe Reader - where does this presentation resume from -> Store processing and memory state of current program

- Next time I open Keynote/Adobe Reader where does this presentation resume from -> Store processing and memory state of current program
- I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events

- Next time I open Keynote/Adobe Reader where does this presentation resume from -> Store processing and memory state of current program
- 2. I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events
- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?

- Next time I open Keynote/Adobe Reader where does this presentation resume from -> Store processing and memory state of current program
- 2. I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events
- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?
- 4. Pages started where does the program reside now?

- Next time I open Keynote/Adobe Reader where does this presentation resume from -> Store processing and memory state of current program
- 2. I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events
- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?
- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?

- Next time I open Keynote/Adobe Reader where does this presentation resume from -> Store processing and memory state of current program
- I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events
- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?
- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?
- 6. Let's start a C program now. Let's write it in an editor. What happens if I open same file in two locations?

- Next time I open Keynote/Adobe Reader where does this presentation resume from -> Store processing and memory state of current program
- I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events
- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?
- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?
- 6. Let's start a C program now. Let's write it in an editor. What happens if I open same file in two locations?

OS manages running multiple programs

- I click on Pages Icon. How does my system know I clicked? -> Need to interpret trackpad events
- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?
- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?
- 6. Let's start a C program now. Let's write it in an editor. What happens if I open same file in two locations?

OS manages running multiple programs

OS interfaces with hardware using easy interface

- 3. Ok. System knows that Pages needs to be started -> where is Pages stored?
- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?
- 6. Let's start a C program now. Let's write it in an editor. What happens if I open same file in two locations?

OS manages running multiple programs

OS interfaces with hardware using easy interface

#### OS transforms programs to processes

- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?
- 6. Let's start a C program now. Let's write it in an editor. What happens if I open same file in two locations?

OS manages resources - CPU, Memory, Disk, Peripherals

OS manages running multiple programs

OS interfaces with hardware using easy interface

#### OS transforms programs to processes

- 4. Pages started where does the program reside now?
- 5. I type something in it -> how does it show on the monitor? where is the data that I typed stored? What happens when I save it?
- 6. Let's start a C program now. Let's write it in an editor. What happens if I open same file in two locations?

 Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource

- 1. Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource
  - 1. We saw in previous example, multiple:

- Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource
   We saw in previous example, multiple:
  - 1. Programs running simultaneously, each thinks they have CPU to themselves

- Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource
  - 1. We saw in previous example, multiple:
    - 1. Programs running simultaneously, each thinks they have CPU to themselves
    - 2. Each thinks they have memory

- Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource
  - 1. We saw in previous example, multiple:
    - 1. Programs running simultaneously, each thinks they have CPU to themselves
    - 2. Each thinks they have memory
- 2. Concurrency : Running multiple things at once

- Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource
  - 1. We saw in previous example, multiple:
    - 1. Programs running simultaneously, each thinks they have CPU to themselves
    - 2. Each thinks they have memory
- 2. Concurrency : Running multiple things at once
  - 1. Can cause problems!

- Virtualisation : Physical resource (CPU, disk, memory) -> virtual resource
  - 1. We saw in previous example, multiple:
    - 1. Programs running simultaneously, each thinks they have CPU to themselves
    - 2. Each thinks they have memory
- Concurrency : Running multiple things at once
  Can cause problems!
- 3. Persistence : Store data permanently

#### CPU Virtualisation Demo

#### **CPU** Virtualisation Demo

1. Run cpu-virtual.py

#### **CPU** Virtualisation Demo

#### 1. Run cpu-virtual.py

#### 2. See the output of **ps** and **top**

- 1. Run cpu-virtual.py
- 2. See the output of **ps** and **top**
- 3. See the activity monitor

- 1. Run cpu-virtual.py
- 2. See the output of **ps** and **top**
- 3. See the activity monitor
- 4. **OS-Fun** Can you do something to make top show a better name than just Python3.6? Can you do it for a C program?

1. Run mem.c

- 1. Run mem.c
- 2. Wait why different addresses?!

- 1. Run mem.c
- 2. Wait why different addresses?!
  - 1. Address space randomisation!

- 1. Run mem.c
- 2. Wait why different addresses?!
  - 1. Address space randomisation!
  - 2. Re-run with it disabled

- 1. Run mem.c
- 2. Wait why different addresses?!
  - 1. Address space randomisation!
  - 2. Re-run with it disabled
  - **3. OS-Fun:** Read about ASLR why does it make sense?

- 1. Run mem.c
- 2. Wait why different addresses?!
  - 1. Address space randomisation!
  - 2. Re-run with it disabled
  - **3. OS-Fun:** Read about ASLR why does it make sense?
- 3. See the activity monitor

- 1. Run mem.c
- 2. Wait why different addresses?!
  - 1. Address space randomisation!
  - 2. Re-run with it disabled
  - **3. OS-Fun:** Read about ASLR why does it make sense?
- 3. See the activity monitor
- 4. Run vmmap

Course Website has all details https://nipunbatra.github.io/teaching/os-fall-19/index.html
